Sample Problems and Detailed Solutions from Chapter 23

Problem 1: Calculating Fringe Width in a Double-Slit Experiment

Question:

A double-slit experiment is set up with a slit separation $d = 0.1\, \text{mm}$, a wavelength $\lambda = 600\, \text{nm}$, and the screen is placed $L = 2\, \text{m}$ away from the slits. Find the fringe width on the screen.

Solution:

Step 1: Convert all units to SI:

- $d = 0.1\, \text{mm} = 1 \times 10^{-4}\, \text{m}$
- $\lambda = 600\, \text{nm} = 6 \times 10^{-7}\, \text{m}$

Step 2: Use fringe width formula:

$$
\Delta y = \frac{\lambda L}{d}
$$

Step 3: Substitute known values:

$$
\Delta y = \frac{6 \times 10^{-7} \times 2}{1 \times 10^{-4}} = \frac{1.2 \times 10^{-6}}{1 \times 10^{-4}} = 0.012\, \text{m}
$$

Answer:

The fringe width is 12 mm.

Problem 2: Determining the Wavelength of an Electromagnetic Wave

Question:

An electromagnetic wave in vacuum has a frequency of $5 \times 10^{14}\, \text{Hz}$. What is its wavelength?

Solution:

Step 1: Recall the wave speed in vacuum:

$$
v = c = 3 \times 10^{8}\, \text{m/s}
$$

Step 2: Use the relation:

$$

$$
\lambda = \frac{v}{f}
$$

Step 3: Substitute:

$$
\lambda = \frac{3 \times 10^{8}}{5 \times 10^{14}} = 6 \times 10^{-7}\, \text{m}
$$

Answer:

Wavelength $\lambda = 600\, \text{nm}$.

Problem 3: Image Formation by a Convex Lens

Question:

An object is placed 30 cm in front of a convex lens with a focal length of 15 cm. Find the position and nature of the image.

Solution:

Step 1: Write the lens formula:

$$
\frac{1}{f} = \frac{1}{d_o} + \frac{1}{d_i}
$$

Step 2: Insert known values:

$$
\frac{1}{15} = \frac{1}{30} + \frac{1}{d_i}
$$

Step 3: Solve for $1/d_i$:

$$\frac{1}{d_i} = \frac{1}{15} - \frac{1}{30} = \frac{2 - 1}{30} = \frac{1}{30}$$

Step 4: Find d_i:

$$d_i = 30\, \text{cm}$$

Step 5: Interpret the result:

- The positive image distance indicates a real, inverted image located 30 cm on the opposite side of the lens.

Answer:

The image is real, inverted, and located 30 cm from the lens.
